

Sire Summary of Ram Test Performance (1995-2012)

Research Center Technical Report 2012-2

Texas AgriLife Research - San Angelo
Texas A&M System

Summary

Performance data from the Texas A&M Ram Performance Tests from 1995 to 2012 were summarized by sire. The calculations used performance of all rams tested that had sire identified. This included 1701 rams from 327 different sires. In order to be included in the report, a sire must have had 4 or more sons with data, or have 3 sons with at least one of those sons on the current year's test. Evaluations based on 3 or fewer sons are less reliable. Substantial changes could occur in the rankings for rams with small numbers of sons if/when data from additional sons become available in future years. A mixed linear model was used to calculate the values. (For more details on how the numbers were calculated contact Dan Waldron).

Methods

The Texas A&M Central Ram Performance Test has been conducted annually to provide a tool for sheep breeders to use in selecting breeding stock. The test's purpose is to identify genetic differences in performance of rams evaluated in the same environment. The test can be considered either as a performance test, where the emphasis is on evaluating the rams on test, or as a progeny test, where the emphasis is on evaluating the sires of the rams on test. This report focuses on the progeny test aspect.

In calculating this summary, the following assumptions were made: 1) all sires were mated to similar ewes, and 2) all sires have a representative sample of sons on test. If a particular sire was mated to genetically superior ewes, his evaluation will be biased upward. No pedigree or performance information is collected on the ewes that

produced the tested rams. So, even though it is known that all ewes are not equal, we must assume that all sires were mated to similar ewes.

If a breeder tests only the best sons of Sire A and merely average sons of sire B, Sire A's evaluation will be biased upward. Of course, it is not feasible to test the entire lamb crop of each sire. Therefore, we assume that each sire group is a representative sample of sons.

Even though the information contained in this report has limitations, it is being presented so sheep breeders can make more informed selection decisions. If you need a ram whose daughters will produce finer fleeces, select from among the rams on test with fine fleeces and use these lists to select a ram from a sire that consistently produced finer-fleeced sons.

The ROM Index (shown on following page) was developed with the aim of combining growth rate, clean fleece weight, staple length, and fiber diameter into one measure of overall genetic merit. The ROM Index is recommended as a selection criterion. However, breeders may want to weight the traits differently from the ROM Index depending on their breeding objective.

This report was compiled by:

Notes about sire rankings

The sire ranking pages show how many sons contributed to each sire's estimate. The column marked 'EBV' shows the sire's Estimated Breeding Value. The EBVs are the expected performance based on the average performance from 1995-2000 at the Texas A&M Sonora Central Ram Performance Test. Performance of progeny will vary in different management programs. However, the differences between sires are not expected to vary in different environments. Therefore, if Sire A has a finer EBV for fiber diameter than Sire B, Sire A's daughters are expected to be finer than those of Sire B, even though they are managed on pasture and expected to be finer than their sires.

The ROM (Registry of Merit) Index was calculated as follows:

$$\begin{aligned} I = & 60 \times [\text{average daily body weight gain in pounds}] \\ & + 4 \times [\text{365-day staple length in inches}] (\text{with no credit above 5.5 inches}) \\ & + 4 \times [\text{365-day clean fleece weight in pounds}] \\ & - 3 \times [\text{fiber diameter in microns } (\mu\text{m}) - 22.9] (\text{no additional credit for being finer than 19.9 microns or coarser than 24.9 microns}) \\ & + 1.25 \times [22.0 - \text{CV}] (\text{with a maximum increase or decrease of 5 points}) \end{aligned}$$

The index calculation used the average fiber diameter and CV from a core sample. Because fleeces were not cored in 1997, sons tested in 1997 were not used for the rankings for fiber diameter (core), fiber variability (CV), and ROM index.

Breeder prefixes, names and towns.

Prefix	Breeder	Town

Sire summary of Texas ram test performance (1995-2012)

Sire Summary of Ram Test Performance (1995-2012)

Alphabetical listing of sires

The following pages list all sires with 4 or more tested sons. Sires are listed in alphabetical order by the breeder prefix. The breeding values are expressed as a deviation from a base. The base was the average performance on test from 1995 to 2000. Therefore, animals with a value of zero are average for this group of rams. A value of .5 in the fleece weight column indicates that this ram is .5 lbs better than the base for clean fleece weight. A value of -.5 in the fleece weight column indicates that he is .5 lbs below the base. The values can be used to make comparisons of different sires. As an example, consider TAES 6090 shown below. He had 11 tested sons. His breeding value for the ROM index is 7.7, indicating that he is 7.7 points better than the base. Immediately below the 7.7 is his rank (7) for ROM index value among all rams with 4 or more tested sons. His ADG value is .002 which indicates that he was slightly above average. His rank is 67, which is near the middle of the 130 rams in the list. A breeding value and rank are shown for each of the 6 traits. TAES 6090 is a very fine ram (rank of 5), but he is near average for growth rate. Sons of this ram would be of interest to ram buyers that want to improve their wool quality in a flock that already has a desirable growth rate. If a producer wants to improve growth rate in a flock, rams with a high breeding value for ADG should be considered.

Sire	Sons	ROM Index	ADG	Staple	Fleece Weight	Fiber Diameter	Fiber CV
+++++							
TAES 6090	11	7.7	0.002	0.17	0.50	-0.77	-0.43
TAES 6090	Rank ->	7	67	32	35	5	23

Several rams have a blank value for ROM index, Fiber Diameter and Fiber CV. These rams had sons tested in 1997 only and in 1997 a core sample from the final fleece was not obtained. Fiber diameter was only determined from the side and britch samples in 1997. A core sample is not directly comparable to a side sample in this situation. So the wool quality measures of rams that had sons tested only in 1997 are not directly comparable to the rest of the rams. Because the wool quality measures are a part of the ROM index calculations, the ROM index values for these rams were also excluded.

Base values :

ROM Index	121.0
ADG	.807 lb/d
Staple Length	5.1 inches
Clean Fleece Wt	11.9 lbs
Fiber Diameter	22.0 microns
Fiber CV	20.3
